PADFENCE

A PADFENCE is a feature that allows you to define the response of your PADTAG to either motion or a defined boundary. You can have the system automatically send a series of e-mails, faxes, telephone calls, pages, or any combination of these responses! There are presently three variations of the PADFENCE:

- 1 **MOTION:** This PADFENCE allows you to specify a speed, that if exceeded, will result in the automatic initiation of your predefined actions.
- 2 **PERIMETER:** This PADFENCE allows your to specify a boundary defined by the radius of a circle, centered on the preset location of an item. If this boundary is breached, your defined actions will be automatically initiated.
- 3 **GEOGRAPHY:** This PADFENCE will allow your to specify a defined, irregularly shaped area, such as a country or state, whose boundaries if breached will result in the initiation of your predefined actions.
